

Taimate Angus & Vineyards

SH1

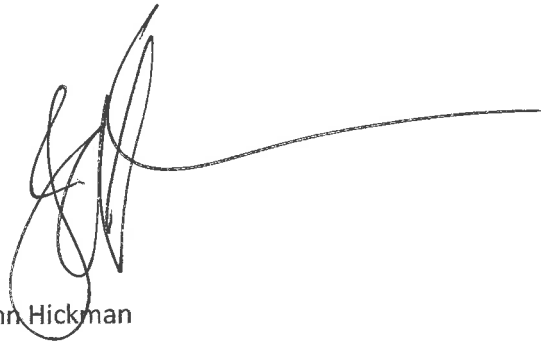

Ward

During the recent development of a vineyard in the 2014-2015 season we used a biological dip as part of our new vine planting programme. This consisted of Mycormax and Superzyme from Roots, Shoots and Fruits. A sticker was used to bind this to the roots.

The difference between the treated and untreated area was noticeable. The survival of plants on the blocks with the treatment of Mycormax and Superzyme, was almost three times that of the untreated areas. This represents a significant cost saving.

We are monitoring this coming seasons production and growth habits of the treated and un-treated areas for further potential benefits.

All future developments and re-planting will now be dipped as part of our standard vineyard programme.
